Name

Surname

Date of birth

Travel document

is my patient with diagnosis: Diabetes mellitus treated with insulin.

The patient must have on board of the plane (no in a baggage hold, it mustn't been exposed to a low temperature) the diabetic equipment and medicines stated at the bottom. Also he must use them during the flight. This is fully in conformity with Security rules of air transport (Transportation Security Administration, www.tsa.gov) and command #1546/2006 of European Commission.

- ✓ Glucometer
- ✓ Insulin cartridges or insulin applicator
- ✓ Insulin pump
- ✓ Device for continual glucose monitoring

This is to certify that Mr./Mrs. , born on , has diabetes mellitus and is being treated using an insulin pump. The pump delivers insulin continuously to the patient's body through an infusion set (tube and needle). The insulin pump must not be disconnected from the body for more than 30 minutes. Otherwise, due to a lack of insulin the patient's blood glucose level increases. Some expendable supplies (battery, infusion sets, cartridges) and insulin are needed to keep the pump working and the patient has to keep them with him/her.
